Linearly immutable continuously time series modeled bivariate stochastic processes with vector values: Distinguishing features

AI EL-Deosokey, AM Ben Aros and MA Ghazal

DOI: <https://doi.org/10.22271/math.2023.v8.i2b.958>

Abstract

Certain observations are assumed to be missed while studying finite continual extended Fourier transformations of time series with precisely stable $(i+j)$ vector values. This is assumed to be the case. This is because the procedure requires studying extended finite Fourier transforms in a standardized manner. The goal is to get as close to an exact interpretation of the results as possible with the data at hand. The results will be put to use in decision-making, which is why this is being done. As a result of this new data, the continuously Fourier transformation will take a starring role in the findings. Asymptotic moments are currently receiving a lot of consideration from researchers all over the world. Case studies on the topic of electrical energy will be used to test our theoretical concepts.

Keywords: Autocovariance, continuously fixed time process, power spectrum, spectrum density, tapered data

1. Introduction

We examine the statistical properties of the linearity relationship between $X(t)$ and $Y(t)$ as represented by the extended finite Fourier transformation, following proposals by D.R. Brillinger (1967) [3], M. Rosenblatt, (1967) [3]; D.R. Brillinger (2001) [4], Ghazal and Farag (2005) [8], Teamah (2004) [1] and Elhassain (2014) [2] and Ghazal, *et al.* (2005) [8]; For a brief overview, of the format of the article, consider the following: (Part1) is an introductory section., Part (2) explored the Approximate Attributes of process as observed, investigated the Approximating aspects of the process as unobserved in Part (3), and in Part (4) we implement our theoretic ideas into practical application, Our method was applied to a study of Average monthly energy imports and exports of the General Electric Corporation between January 2011 and December 2020.

2. The Observed Process's Approximate Attributes

Presume of a fixed sequence that is a vector of values $(i + j)$

$$\mathfrak{R}(t) = [X(t) \ Y(t)]^T \tag{2.1}$$

$t = 0, \pm 1, \pm 2, \dots$, $X(t)$ i - valued-vector and $Y(t)$ j - valued-vector. In a definition of the mean function, we suppose that the process (2.1) is a fixed $(i + j)$ valued- vector sequence with parameters $[X_r(t) \ Y_s(t)]^T, r = 1, 2, \dots, j, s = 1, 2, \dots, i$ and that its moments is valid, thus we may deduce the mean function as follow.

$$EX(t) = 0, EY(t) = 0 \tag{2.2}$$

With covariance

$$\begin{aligned} E\{[X(t + g) - \tau_x][X(t) - \tau_x]^T\} &= \tau_{xx}(g) \\ E\{[X(t + g) - \tau_x][Y(t) - \tau_y]^T\} &= \tau_{xy}(g) \\ E\{[Y(t + g) - \tau_y][Y(t) - \tau_y]^T\} &= \tau_{yy}(g) \end{aligned} \tag{2.3}$$

With density spectrums

$$\begin{aligned} f_{xx}(h) &= \int_{-\infty}^{\infty} \frac{1}{(2\pi)} \sum_{g=-\infty}^{\infty} \tau_{xx}(g) \text{Exp}(-ihg) \\ f_{xy}(h) &= \int_{-\infty}^{\infty} \frac{1}{(2\pi)} \sum_{g=-\infty}^{\infty} \tau_{xy}(g) \text{Exp}(-ihg) \\ f_{yy}(h) &= \int_{-\infty}^{\infty} \frac{1}{(2\pi)} \sum_{g=-\infty}^{\infty} \tau_{yy}(g) \text{Exp}(-ihg), \text{ for } -\infty < h < \infty \end{aligned} \tag{2.4}$$

That $\beta_a(t), a = 1, 2, \dots, i, (t \in R)$ exists for all t, which is independent on $\mathfrak{R}(t)P[\beta_a(t) = 1] = p_a, P[\beta_a(t) = 0] = q_a,$

Take note that $E\{\beta_a(t)\} = P,$

Independent data can be used successfully without caring about the results of another. For the modified series perception, considering $\delta(t) = \beta(t)\mathfrak{R}(t),$

Where $\delta_a(t) = \beta_a(t)\mathfrak{R}_a(t),$

and $\beta_a(t) = \begin{cases} 1, & \text{if } X_a(t), Y_a(t) \text{ are recorded} \\ 0, & \text{otherwise} \end{cases},$

Assumption

The time interval (t) is limited in the data window $\ell_a^{(T)}(t)$ so that it has a restricted range, a finite variation, and vanishes between 0 and T - 1. Let

$$T^{-1} \int_0^T \ell_a^{(T)}(t) dt \xrightarrow{T \rightarrow \infty} \int_0^1 \ell_a(g) dg, \quad a = \overline{1, i}$$

$$\gamma_{a_1, \dots, a_k}^{(T)}(h) = \int_0^T [\prod_{r=1}^k \ell_{a_r}^{(T)}(t)] \exp\{-iht\} dt$$

3. Approximating Aspects of the Unobserved Procedure

Theorem 3.1. [7]

If we assume that the fixed stochastic procedure is represented by $X_a(t), Y_a(t), a = 1, 2, \dots, \min(i, j),$ that missing data points are represented by $\delta_a(t) = \beta_a(t)\mathfrak{R}_a(t), a = 1, 2, \dots, \min(i, j),$ We obtain the following if $\beta_a(t)$ is a Bernoulli sequence of stochastic process that satisfies (2.8) and (2.9).

$$E\{\delta_a(t)\} = 0, \tag{3.1}$$

$$Cov\{\delta_{a_1}(t_1), \delta_{a_2}(t_2)\} = P_{a_1 a_2} \begin{bmatrix} \tau_{xx}(g) & \tau_{xx}(g)K(h)^T \\ K(h)\tau_{xx}(g) & K(h)\tau_{xx}(g)K(h)^T \end{bmatrix}, \tag{3.2}$$

Lemma 3.1.

Specifically, if we set $\omega_a^{(T)}(h), a = 1, \dots, \min(j, i)$ similar to

$$\omega_a^{(T)}(h) = \left[2\pi \int_0^T (\ell_a^{(T)}(t))^2 \right]^{-1/2} \int_{-\infty}^{\infty} \ell_a^{(T)}(t) \delta_a(t) \exp\{-iht\} dt, \text{ for } h \in R \tag{3.3}$$

Then the dispersion of $\omega_a^{(T)}(h)$ is thus determined to be as follows:

$$\begin{aligned} D\omega_a^{(T)}(h) &= \\ P_{aa} \times & \left[\begin{array}{cc} \int_{-\infty}^{\infty} f_{aa}(h - \psi) \times \zeta_{aa}(\psi) d\psi & \int_{-\infty}^{\infty} f_{aa}(h - \psi) K(h)^T \times \zeta_{aa}(\psi) d\psi \\ \int_{-\infty}^{\infty} K(h) f_{aa}(h - \psi) \times \zeta_{aa}(\psi) d\psi & \int_{-\infty}^{\infty} K(h) f_{aa}(h - \psi) K(h)^T \times \zeta_{aa}(\psi) d\psi \end{array} \right] \end{aligned} \tag{3.4}$$

Where

$$\zeta_{aa}^{(T)}(x) = \left[\int_0^T (2\pi) (\ell_a^{(T)}(t) dt) \right]^{-1} |\partial_a^{(T)}(x)|,$$

$$\partial_a^{(T)}(x) = \int_0^T \ell_a^{(T)}(t) \exp(-ixt) dt, x \in R$$

Proof.

Using equation (3.3) we have

$$D\omega_a^{(T)}(h) = p_{a_1 a_2} \left[\begin{array}{cc} \int_{-\infty}^{\infty} f_{a_1 a_2}(u) \times \zeta_{a_1 a_2}(h_1 - u, h_2 - u) du & \int_{-\infty}^{\infty} f_{a_1 a_2}(u) K(h)^T \times \zeta_{a_1 a_2}(h_1 - u, h_2 - u) du \\ \int_{-\infty}^{\infty} K(h) f_{a_1 a_2}(u) \times \zeta_{a_1 a_2}(h_1 - u, h_2 - u) du & \int_{-\infty}^{\infty} K(h) f_{a_1 a_2}(u) K(h)^T \times \zeta_{a_1 a_2}(h_1 - u, h_2 - u) du \end{array} \right]$$

When $a_1 = a_2 = a, a = 1, 2, \dots, \min(i, j)$, and $h_1 = h_2 = h, h \in R$, via Substitution $h - u = \psi$, Hence, we get equation (3.4).

Theorem 3.2. If $\zeta_{aa}^{(T)}(x), a = 1, \dots, \min(i, j), x \in R$ is limited and continually function at the point $x = h, h \in R$, then the spectral density function $f_{aa}(x), a = 1, \dots, \min(i, j), x \in R$ is also limited and continuously at this point then.

$$\lim_{T \rightarrow \infty} D\omega_a^{(T)}(h) = \begin{bmatrix} f_{aa}(h) & f_{aa}(h)K(v)^T \\ K(v)f_{aa}(h) & K(v)f_{aa}(h)K(v)^T \end{bmatrix}, a = 1, \dots, \min(i, j) \tag{3.5}$$

Proof

To prove formula (3.5), we have to establish that

$$\lim_{T \rightarrow \infty} \left| D\omega_a^{(T)}(h) - p_{aa} \begin{bmatrix} f_{aa}(h) & f_{aa}(h)K(v)^T \\ K(v)f_{aa}(h) & K(v)f_{aa}(h)K(v)^T \end{bmatrix} \right| = 0, \tag{3.6}$$

Lemma (3.1) provides the following.

$$\begin{aligned} & \left| D\omega_a^{(T)}(h) - p_{aa} \begin{bmatrix} f_{aa}(h) & f_{aa}(h)K(v)^T \\ K(v)f_{aa}(h) & K(v)f_{aa}(h)K(v)^T \end{bmatrix} \right| \leq \\ & \leq p_{aa} \left[\begin{array}{cc} \int_{-\infty}^{\infty} |f_{aa}(h-\psi)| & \int_{-\infty}^{\infty} |f_{aa}(h-\psi)K(v)^{(T)}| \\ \int_{-\infty}^{\infty} |K(v)f_{aa}(h-\psi)| & \int_{-\infty}^{\infty} |K(v)f_{aa}(h-\psi)K(v)^{(T)}| \end{array} \right] - \\ & - \left[\begin{array}{cc} \int_{-\infty}^{\infty} |f_{aa}(h)| & \int_{-\infty}^{\infty} |f_{aa}(h)K(v)^{(T)}| \\ \int_{-\infty}^{\infty} |K(v)f_{aa}(h)| & \int_{-\infty}^{\infty} |K(v)f_{aa}(h-\psi)K(v)^{(T)}| \end{array} \right] \eta_{aa}^{(T)}(\psi) d\psi \leq \\ & \leq p_{aa} \left[\begin{array}{cc} \int_{-\infty}^{\psi} |f_{aa}(h-\psi)| & \int_{-\infty}^{\psi} |f_{aa}(h-\psi)K(v)^{(T)}| \\ \int_{-\infty}^{\psi} |K(v)f_{aa}(h-\psi)| & \int_{-\infty}^{\psi} |K(v)f_{aa}(h-\psi)K(v)^{(T)}| \end{array} \right] - \\ & - p_{aa} \left[\begin{array}{cc} \int_{-\infty}^{\psi} |f_{aa}(h)| & \int_{-\infty}^{\psi} |f_{aa}(h)K(v)^{(T)}| \\ \int_{-\infty}^{\psi} |K(v)f_{aa}(h)| & \int_{-\infty}^{\psi} |K(v)f_{aa}(h-\psi)K(v)^{(T)}| \end{array} \right] \eta_{aa}^{(T)}(\psi) d\psi + \\ & + p_{aa} \left[\begin{array}{cc} \int_{-\psi}^{\psi} |f_{aa}(h-\psi)| & \int_{-\psi}^{\psi} |f_{aa}(h-\psi)k(v)^T| \\ \int_{-\psi}^{\psi} |k(v)f_{aa}(h-\psi)| & \int_{-\psi}^{\psi} |k(v)f_{aa}(h-\psi)k(v)^T| \end{array} \right] - \end{aligned}$$

$$\begin{aligned}
 & - p_{aa} \left[\begin{array}{cc} \int_{-\psi}^{\psi} |f_{aa}(h)| & \int_{-\psi}^{\psi} |f_{aa}(h)K(v)^{(T)}| \\ \int_{-\psi}^{\psi} |K(v)f_{aa}(h)| & \int_{-\psi}^{\psi} |K(v)f_{aa}(h-\psi)K(v)^{(T)}| \end{array} \right] \eta_{aa}^{(T)}(\psi) d\psi + \\
 & - p_{aa} \left[\begin{array}{cc} \int_{\psi}^{\infty} |f_{aa}(h-\psi)| & \int_{\psi}^{\infty} |f_{aa}(h-\psi)k(v)^T| \\ \int_{\psi}^{\infty} |k(v)f_{aa}(h-\psi)| & \int_{\psi}^{\infty} |k(v)f_{aa}(h-\psi)k(v)^T| \end{array} \right] - \\
 & - p_{aa} \left[\begin{array}{cc} \int_{\psi}^{\infty} |f_{aa}(h)| & \int_{\psi}^{\infty} |f_{aa}(h)K(v)^{(T)}| \\ \int_{\psi}^{\infty} |K(v)f_{aa}(h)| & \int_{\psi}^{\infty} |K(v)f_{aa}(h-\psi)K(v)^{(T)}| \end{array} \right] \eta_{aa}^{(T)}(\psi) d\psi
 \end{aligned}$$

$B_1 + B_2 + B_3$

We'll clarify each one. In particular, we obtain since $f_{ab}(\psi)$ is continuous at $\psi = h, a, b = 1, \dots, \min(i, j)$, then we have

$$\begin{aligned}
 B_2 &= p_{aa} \left[\begin{array}{cc} \int_{-\psi}^{\psi} |f_{aa}(h-\psi)| & \int_{-\psi}^{\psi} |f_{aa}(h-\psi)k(v)^T| \\ \int_{-\psi}^{\psi} |k(v)f_{aa}(h-\psi)| & \int_{-\psi}^{\psi} |k(v)f_{aa}(h-\psi)k(v)^T| \end{array} \right] - \\
 & - p_{aa} \left[\begin{array}{cc} \int_{-\psi}^{\psi} |f_{aa}(h)| & \int_{-\psi}^{\psi} |f_{aa}(h)K(v)^{(T)}| \\ \int_{-\psi}^{\psi} |K(v)f_{aa}(h)| & \int_{-\psi}^{\psi} |K(v)f_{aa}(h-\psi)K(v)^{(T)}| \end{array} \right] \eta_{aa}^{(T)}(\psi) d\psi + \\
 & = p_{aa} \left[\begin{array}{cc} \int_{-\psi}^{\psi} |f_{aa}(h-\psi) - f_{aa}(h)| & \int_{-\psi}^{\psi} |f_{aa}(h-\psi)k(v)^T - f_{aa}(h)k(v)^T| \\ \int_{-\psi}^{\psi} |k(v)f_{aa}(h-\psi) - f_{aa}(h)k(v)| & \int_{-\psi}^{\psi} |k(v)f_{aa}(h-\psi)k(v)^T - k(v)f_{aa}(h)k(v)^T| \end{array} \right]
 \end{aligned}$$

$$B_2 \leq \Omega \int_{-\psi}^{\psi} \eta_{aa}^{(T)}(\psi) d\psi \leq \Omega \int_{-\infty}^{\infty} \eta_{aa}(\psi) d\psi \eta_{aa}^{(T)}(\psi) d\psi$$

Assuming that $f_{ab}(\psi)$ is continuous at $\psi = h, a, b = 1, \dots, \min(i, j)$, we've got

$B_2 \leq \Omega$. Now, B_2 is very small, so any Ω very small, so $B_2 = 0$. With a constant G that limits the value of $f_{aa}(h), a = 1, \dots, \min(i, j), h \in R$ to be limited, we have

$$B_1 \leq 2G \int_{-\infty}^{-\psi} \eta_{aa}^{(T)}(\psi) d\psi \xrightarrow{T \rightarrow \infty} 0,$$

In a similar manner, $B_3 \xrightarrow{T \rightarrow \infty} 0$. Therefore

$$\left| D\omega_a^{(T)}(h) - p_{aa} \begin{bmatrix} f_{aa}(h) & f_{aa}(h)K(v)^T \\ K(v)f_{aa}(h) & K(v)f_{aa}(h)K(v)^T \end{bmatrix} \right| \xrightarrow{T \rightarrow \infty} 0$$

The theorem has been proved, then.

4. Practical Study

4.1 Energy Import/Export Investigation

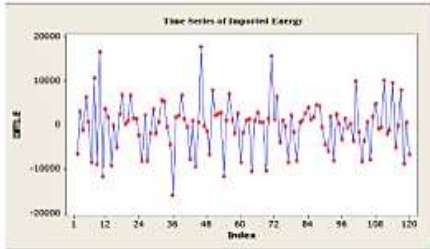

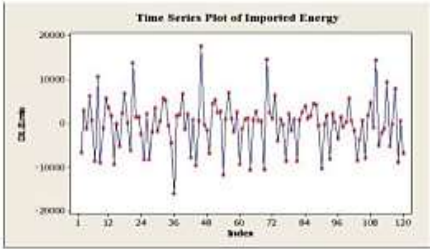

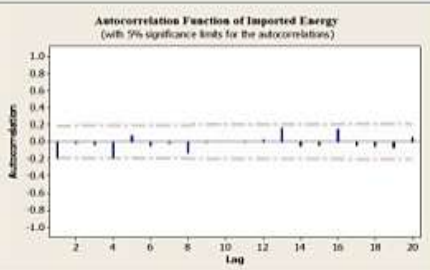

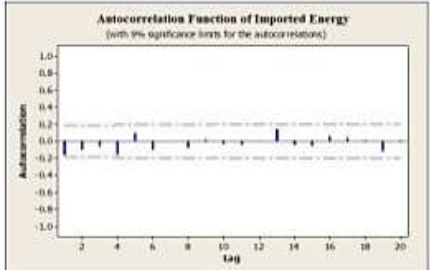

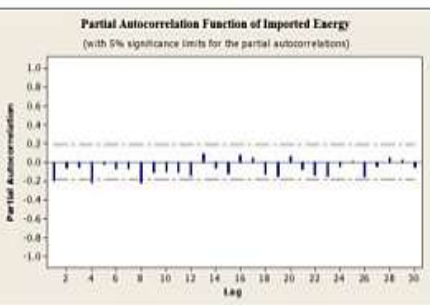

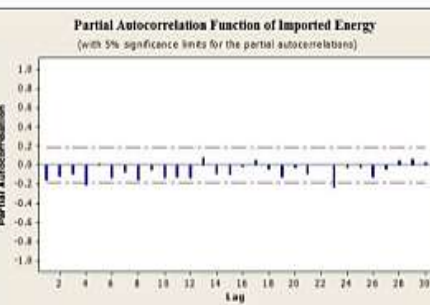

From January 2011 to December 2020, this analysis gives a monthly average of the Energy exported by General Electric Company and the Energy imported by the company.

4.1.1 Energy Import Analytics

We will compare the results we get using our model of time process with missed values to the results from the standard procedure, when all values are recorded.

Assuming the data $X_a(t)$, ($t = (1, 2, \dots, T]$), which is the average monthly Energy that is imported, where all data of the series are recorded, and recorded with some missed, we can write the findings as $\zeta_a(t) = \beta_a(t)X_a(t)$, $a = 1, 2, \dots, i$, such that $X_a(t)$, ($t = 0, \pm 1, \dots$) is a fixed i -valued-vector process. Table (1) compares Findings for the normal Scenario $\beta = 1$, $\zeta_a(t) = X_a(t)$ and that results when some values are missed at random ($\beta = 0$).

4.1.2 Analytical Exported of Energy

In this study, we will compare the results produced using the standard methods, in which all data is observed, with those obtained using a fixed-time process model with partial missed of data.

With a fixed j -valued-vector time process, $Y_a(t)$, ($t = (1, 2, \dots, T]$) and a stochastically independent Bernoulli sequence, $\beta_a(t)$, the results can be written as $\varpi_a(t) = \beta_a(t)Y_a(t)$, $a = 1, 2, \dots, j$, an average monthly energy exports with complete records is denoted by $Y_a(t)$, where $a = 1, 2, \dots, j$. Table 2 compares the results for the two scenarios where some data are missing at random ($\beta = 0$) and results for the standard case ($\beta = 0$).

4.1.3 Regression Model Analysis of Energy Imports and Exports

In this analysis, we will evaluate the two scenarios listed in the table below using our outcomes from monthly averages of energy imports and exports are analyzed using a regression model where the outcomes from model with some missed of observations and the classical results from the same model when all observations are available is shown through table (3).

Table 3: Missing Data in Regression Analysis: A Comparison to Complete Data

Without missing data					With missing data					
The regression model is					The regression model is					
Exported Energy = 3260 + 0.190 imported Energy					Exported Energy = 2413 + 0.189 imported Energy					
Predictor	Co-ef	SE Co-ef	T	P	Predictor	Co-ef	SE Co-ef	T	P	
Constant	3260	1242	2.49	0.013	Constant	2413	1374	1.49	0.038	
imported Energy	0.1901	0.003589	30.29	0.000	imported Energy	0.189	0.006423	24.83	0.000	
S = 459.317 R-Sq = 88.5% R-Sq(adj) = 88.4%					S = 645.097 R-Sq = 82.8% R-Sq(adj) = 82.7%

4.1.4 Conclusion

1. The findings of missing data time process analysis were identical to those obtained from regular time series analysis.
2. As with missed data, the results of the investigated for both the X(t) and Y(t) regression models are equivalent since they met the analytical, numerical, and least squares constraints for a regression model between standard time series.
